Prototype Testing Guidelines

Goal

This prototype shows women that hands that look clean are not necessarily clean. Through an augmented reality (AR) experience, they can see germs that are invisible to the naked eye.

When to run the test

Trainers should run the test at moments when the trainees think their hands are clean, for example before tea. The point is for them to realize that their hands can be dirty even when they don't seem to be.

Run the test twice in one week, on two different days. After the second session, stop using the prototype and start the observation.

Ideally, follow the test with a handwashing activity.

How to install the prototype

Open the link below to download and install the prototype through TestFlight.

https://testflight.apple.com/join/ETr6GVE1

How to use the prototype

1. Open the app. A green button appears in the middle of the screen.
2. Tap the button. Hold the iPad about 30–40 cm above the trainee's hands, screen facing up, so the back camera looks down at her hands. Keep faces out of the picture.
3. Follow the voiceover, which guides you through the experience. Make sure the volume is on. The voiceover is in Swahili.
4. Look at your hands as they normally appear. The voiceover explains that they aren't as clean as they look.
5. Watch the UV light turn on and reveal the germs that can't be seen under normal light.
6. Switch back and forth between UV and regular light to compare.
7. Ask the participants to go and wash their hands in the end of the activity.

The prototype does not store or save anything, anywhere. We are not collecting any type of data.

What we want to learn

With this test, we want to understand how the women react when they see the germs on their hands. In particular:

- How do they react when they see the germs on their hands?
- How do they approach and interact with AR?
- How impactful are the AR simulated germs to influence their thinking?

Success criteria

Trainers take videos of the trainees as they engage with the prototype (with the consent of the trainees).

After the second session, trainers should note any change in the trainees' handwashing habits during the observation period.
